Complete mill quality available in real time

All the vital information is available in real time, to the right personnel – so we can control the quality at yarn clearing in combination with other mill processes, and take immediate action where needed.

Uster Quality Expert has made a significant improvement to quality management at Hoa Tho Textile, one of Vietnam's largest clothing and yarn producers. Fast access to essential quality data, from all its spinning mill processes, is critical to integrating quality control from yarn clearing with results from blowroom, carding and roving.

Mr. Nguyen Huu Khanh, the group's Yarn Technology Manager, says it's a major benefit to have all the vital information available centrally, connecting Uster AFIS Pro 2, Uster Tester 6, Uster Tensojet 5 and Uster Quantum 3 yarn clearers in one system under Uster Quality Expert.

Real-time quality results are available to managers, allowing quick responses to any issues – helped by guidance from Assistant Q. The system saves time, reduces e-mail traffic and frees up senior management from routine tasks. And the Uster Mobile Alert App keeps personnel in touch when away from the mill.

Monitoring overall quality performance is very important for Hoa Tho Textile, and Uster Quality Expert helps optimize the performance of all stages mill production.

Hoa Tho Textile – Garment Joint Stock Corporation

Quality Expert interview with Mr. Nguyen Huu Khanh

Founded in 1962, Hoa Tho belongs to one of the most well-established and largest textile and garment enterprises in Vietnam.

The company operates in two main fields:

- Manufacturing, trading and exporting garments and yarn products
- Importing essential materials and equipment for garment and yarn production

Hoa Tho offers a diversified portfolio covering products such as suits, pants, jackets, work-wears etc. With assured quality and trendy designs, Hoa Tho's products are highly appreciated by customers, including those in demanding markets such as the USA, Europe, Japan and South Korea. With its rich heritage, large-scale production, creative and enthusiastic human resources, and high quality products, Hoa Tho continuously enhances its competitiveness and strengthens its leadership and brands in both domestic and international markets.

Uster Quality Expert plays a central role in the way quality is managed throughout the spinning mills of the Hoa Tho Group. We asked Mr. Khanh for some insights into what has changed since the installation of the Uster Tester 6 featuring Uster Quality Expert.

What are the main benefits you have experienced?

Definitely one of the main benefits is having all the information in one place. We have connected our Uster AFIS Pro 2, Uster Tester 6, Uster Tensojet 5 and Uster Quantum 3 yarn clearers to one system. It is very important for us to control the quality in yarn clearing in combination with the quality results from blowroom, carding and roving.

How has this helped you to improve quality management?

Our mill managers now have a common reference to compare the quality produced in each mill. They can access quality information very easily. In the past, we needed more time to create the quality reports, which were being distributed by email. The information took too long to reach the right people and was not always up to date. Now, the latest quality results are available in real time and any required action can be taken immediately.

As well as the mill managers, who else benefits from Uster Quality Expert?

Mill personnel spend less time to prepare Excel sheets and reports. We no longer have to rely on printed reports, since all the information is now available in the system. Our e-mail traffic has greatly reduced and we all have access to the information we need directly from our workstations.

Personally, I have a better view of the quality produced in our mills, while spending less time to get the information I need.

Is the Uster Mobile Alert App used by your mill personnel?

Certainly! It is a great tool to access information while on the road, or away from the spinning mill. We can be notified and solve most issues faster on the shopfloor. Our mill management has better control and this results in less problems needing to be escalated to me.

What are the main quality attributes you are interested in monitoring?

The overall quality performance is very important for us. So, the fiber to yarn reports from Uster Quality Expert are very useful to understand the performance of all stages of spinning mill production. We particularly focus on the changes in short fiber content from process to process, as well as nep levels.

What do you think of the advice from Assistant Q? Would you say that he has become good friends with your personnel?

(Laughs) Yes, we can say that Assistant Q is our friend now!

Mr. Khanh, thank you very much for these valuable insights.
